CHAPTER I

STATEMENT OF THE PROBLEM

This chapter contains an introduction to the purpose of the study, a brief literature review on the need for divorce counseling, a description of a longitudinal study on divorce and the study's influence on the development of a family court service, and a description of Clackamas County Family Court Service with an analysis of its commitment to research.

SECTION I: INTRODUCTION: PURPOSE OF THE STUDY

This report presents a descriptive study of characteristics of persons using a family court service. A comparison is made between persons using the service and a sample of the population whom the agency was designed to serve.

The purposes of the study were to determine if the agency was serving the client population it was designed to serve and to provide a socio-demographic data base for further research and planning at the agency.

SECTION II: BACKGROUND

The following is a brief literature review to acquaint the reader with the theoretical background out of which the Clackamas County Family Court Service emerged.

Numerous studies have pointed to the distress experienced by divorcing persons (Goode 1956; Gurin, Veroff & Field 1960; Westman 1970; Weiss 1975; Campbell, Converse & Rodgers 1976; Hetherington, Cox & Cox 1976; Jones 1977; Kitson 1977).

Much has been written on the negative impact of divorce on children (Despert 1953; McDermott 1968, 1970; Westman 1970, Wallerstein & Kelly 1974, 1975, 1976, 1977). On the other hand some studies (Nye 1957; Landis 1960) would indicate that over time, in the words of one researcher,

Children from happy marriages are better adjusted than children from divorced families, but those from divorced parents are better adjusted than those from parents whose marriages are intact but unhappy....(Udry 1971)

Most studies have directly or indirectly pointed to constructive parent-parent and parent-child relationships as the most significant factors in the satisfactory adjustment of the children to divorce.

The Wallerstein & Kelly and Hetherington studies indicate that the first year after divorce is the most stressful for both parents and their children. Furthermore, other sources (Kressel, Lopez-Morillas, Weinglass & Deutsch 1978) conclude that the adversarial nature of the lawyer-run divorcing process probably further contributes to the distress of the divorcing parties. They also conclude that the adversarial court process is ineffective as a resource for conflict resolution. They cite the Hetherington, Cox & Cox study for how poorly court decreed visitation agreements are kept; they cite Jones, Gordon & Sawhill (1976) for the low compliance with court ordered child support agreements; and they cite Cavanagh & Rhode (1976) on the insufficient and inadequate quality of divorce settlements.

According to Kressel, et al., non-adversarial models are beginning to emerge (Coogler 1977; Kressel, Deutsch, Jaffe, Tuchman & Watson 1977; Lightman & Irving 1976; Wallerstein & Kelly 1977). Wallerstein & Kelly propose a time-limited (six-session), crisis-oriented service that is "child centered, preventative, and planning oriented" (Wallerstein & Kelly 1977).

Counseling services for divorcing persons have primarily been provided by Family or Conciliation Courts. Kressel, et al. in their analysis of the need have noted that historically these services have attempted to reconcile marriages rather than assist those wishing to end them in resolving the numerous issues inherent in the divorcing process.

SECTION III; IDCAP: A STUDY OF CLACKAMAS COUNTY
DIVORCES AND ITS INFLUENCE ON THE DEVELOPMENT
OF A FAMILY COURT SERVICE

In 1976 the Clackamas County Family Court Service was established by the Circuit Court in Clackamas County Oregon. The Family Court Service developed out of an awareness on the part of the Circuit Court and County Juvenile Department that some sort of resource was needed to provide assistance to the expanding divorcing population of Clackamas County. In 1975 an LEAA funded longitudinal study of divorcing parents and their children was initiated in Clackamas County, Divorce: Its Impact on Parents and Children (IDCAP), (Cohen 1978). Among questions found in the IDCAP study were four directly related to the establishment of a court sponsored counseling service (see IDCAP questions numbered 66, 67, 68, 69). Respondents were asked if they could have used or would use a

court counseling service wherein parents could work out a parenting relationship that would be most beneficial for their children. A majority of respondents indicated that they would have found such a service helpful and would use this service if it were available. The authors of IDCAP and the Circuit Court concluded from the study that a public divorce counseling service was needed to assist the population studied.

The service was designed to help divorcing parents resolve issues in their divorce and ongoing parenting relationship so that the children of the divorcing parents would be least negatively affected by the divorcing process.

SECTION IV: CLACKAMAS COUNTY FAMILY COURT SERVICE: A DESCRIPTION

The Family Court Service was designed to meet the following goals and objectives: To provide short-term, individual, conjoint and group counseling to couples contemplating and/or involved in divorce proceedings. Objectives include helping parents to constructively resolve custody, visitation, and child support issues; assisting in the development of cooperative parenting relationships, whether married or divorced; providing advocacy for children of divorcing families; and, when appropriate, facilitating the avoidance of unnecessary divorces.

The Family Court Service is available to Clackamas County families who are considering, have filed for, or have completed divorce proceedings. Families with minor children are the agency's highest priority. Participation is voluntary and confidential. Custody studies are not done at the Family Court Service and counselors may not be subpoenaed to testify in court regarding cases. The object of the service is to

provide a protected, non-adversarial environment for the resolution of issues inherent in the divorcing process.

Families are charged a \$35.00 fee for utilization of the Family Court Service. Since July 1, 1976, the \$35.00 fee is a part of the divorce filing fee for all persons filing for divorce in Clackamas County. Those families filing for divorce after July 1, 1976 have their fees paid automatically at the time of filing. Those families who filed before July 1, 1976, must pay the the \$35.00 fee, unless waived, out of their pocket.

Families utilizing the service generally are assigned to one staff member who works with the family through the usual six to eight counseling sessions.

SECTION V: RESEARCH AND THE CLACKAMAS COUNTY FAMILY COURT SERVICE

The Clackamas County Family Court Service grew out of a research project and continues its investment in research and evaluation. In its short life, agency staff have participated not only in the ongoing IDCAP study but also in a client satisfaction survey, A Consumer Evaluation of the Clackamas County Family Court Service (Lee & Watne 1978) and a parental perception study, Parental Perceptions of Behavioral Changes in Children Following Divorce (Borr 1978). Currently another study is being designed to determine the cost and service effectiveness of mandating certain types of cases through the Family Court Service (targeted to begin July 1, 1979). If this study is implemented as designed, the agency staff would nearly double in size and would be comprised of about an equal number of research and counseling staff.

Its authors conclude, from the agency's history of research and evaluation, its support of this study, and the planned study, that the Family Court Service has been and is heavily invested in research and evaluation.

SECTION VI: THE PROBLEM: WHO IS BEING SERVED?

The authors reasoned that the above studies did not address the important issue of whether or not the Agency is serving its target population.

According to Gilbert & Specht (1974), and others (Piven & Cloward 1971; Moles, Hess & Fascione 1968; Harrington 1962), many persons deemed in need of services may not avail themselves of existing social services and, further, that many persons in need of social services can be reached only by special delivery methods.

The Family Court Service Director, Nolan Jones, and Family Court Service Research Assistant, Donna Ricketts, agreed that the question the authors were interested in was significant to them in their planning process. Further, they asserted that the previous studies did not provide an adequate client demographic data base for their proposed mandated client study, and suggested that the authors' study could in part provide the client demographic data base required for that study. The authors confirmed that this data base would be included in the scope of their study.

CHAPTER II

METHODOLOGY

SECTION I: OVERVIEW

As noted above, we chose for our first group (hereinafter referred to as the Surveyed Group, N = 114), a systematic sample derived from the IDCAP study. For consistency, we obtained information from all those files which contained a completed interview schedule. Data for our contrast group (hereinafter referred to as the Served Group, N = 139) was obtained from the closed case files of clients served at the Agency during the period July 1976 through November 1978. A copy of the Data Collection Schedule is included in the Appendix. We matched the Served Group with the Surveyed Group on the following three criteria used in the IDCAP study: 1) cases chosen were only those of clients who had filed for divorce and whose final decree was not entered at the time they filled out the Intake Application, 2) clients were divorcing from their first marriage, and 3) clients had at least one minor child from this first marriage.

It should be noted that the Surveyed and Served Groups are not mutually exclusive. Some people in the Surveyed Group chose to utilize the service when it became available and therefore became part of the Served Group as well. The comparability of the samples may be compromised as a result of the overlap of the samples. However, it can be argued that there is some logic to this procedure in that the majority

of the Surveyed respondents indicated that they would use such a service were it available and the Agency has not been in existence long enough to develop a large enough data base to provide mutually exclusive populations from which samples could be drawn.

Files in both samples contained information from forms filled out separately by the mother and father. Thus, in the Served sample, if the father was divorcing from his second marriage, data on him would not be used; while if his wife were divorcing from her first marriage, data on her would be used.

Six of the variables discussed herein (age, length of marriage, employed income, sex, number of children, and education) were chosen using two criteria: 1) the data should be demographic in nature; and 2) the data should be available in the files of both the Surveyed and Served Groups.

A seventh variable (people talked to about the problems leading to petition) was included because the authors felt this might offer the Agency information on future referral sources and areas of outreach. This information was also readily available from the files of both Surveyed and Served Groups.

The eighth and final variable (referral source) was included to determine who, in fact, referred respondents to the Agency and, again, to provide information for use in future outreach efforts.

Chi squares were computed to compare the Surveyed and Served Groups on each of the separate variables except that of referral source, since data on this variable was only available for the Served Group. For the referral source, percentages of referral categories were computed from the total responses. In addition, the authors calculated chi squares for sub-variables of the variable of persons talked to.

SECTION II: AGE

For the Surveyed Group, age was determined by observing the "age" box on the Petition for Dissolution of Marriage form, which form was always included in the respondent's file. For the Served Group, when there was no copy of the Petition in the file, age was determined by subtracting the client's date of filing for divorce (available on the Intake Application) from the client's date of birth (also available on the Intake Application). This was done to insure that ages for both the Surveyed and Served Groups would be their age at the time of Petition for Dissolution.

Ages were computed in full year increments such that a person born in December of 1946 and filing for divorce in December of 1976 would be rated as aged 30 years at time of filing the petition; whereas one born in December of 1946 and filing in November of 1976 would be rated as age 29 years.

SECTION III: LENGTH OF MARRIAGE

For the Surveyed Group, length of marriage was determined by subtracting the date of marriage from the date of Petition for Dissolution of Marriage (both available on the Petition). For the Served Group, length of marriage was determined by the same means except when no Petition was available in the file. In the latter case, date of marriage and date of petition were taken from the Intake Application form from sections as follows:

Have you filed for divorce ☐ No ☐ Yes
Date _____
Date of Marriage _____.

Length of marriage was also computed in full year increments, such that a person married in December of 1946 and filing for divorce in December of 1976 would be rated as married 30 years; whereas one born in December of 1946 and petitioning for divorce in November of 1976 would be considered to be married 29 years.

SECTION IV: EMPLOYED INCOME

For the Surveyed Group, employed income was determined by observing the response to the following items on the Interview Schedule:

9. Are you currently working?
 ___ Yes, ___ No.
 If YES, are you working
 ___ Full time, ___ Part time,
 ___ Other (describe) _____
11. IF YOU ARE WORKING, what is your
 monthly income before anything is
 taken out?
 ___ less than \$200, ___ \$200-399,
 ___ \$400-599, ___ \$600-799,
 ___ \$800-999, ___ \$1000-1199,
 ___ \$1200-1399, ___ \$1400-1599,
 ___ \$1600-1799, ___ \$1800 & up

For the Served Group, this data was obtained from responses to the following questions on the Intake Application:

2. Work situation (check one)
 Employed full time _____
 Employed part time _____
 Unemployed _____
 Retired _____
 Student _____
 Homemaker _____
 Other: _____
3. Monthly Income:
 (Before anything is taken out):

SECTION V: PEOPLE TALKED TO

To whom respondents spoke with about their problems was determined from the Surveyed Group by their responses to item 26 on the Interview Schedule:

26. (a) Since the divorce was filed, have you talked with anyone concerning the things that led you and your spouse to file?

____ Yes ____ No

- (b) IF "YES": Who have you talked to about these problems? Have they been helpful or not helpful?

Person Involved	<u>Helpful</u>	Not <u>Helpful</u>	Not <u>Sure</u>	Not <u>Talked To</u>
____ Relative	_____	_____	_____	_____
____ Clergyman	_____	_____	_____	_____
____ Family Doctor	_____	_____	_____	_____
____ Attorney	_____	_____	_____	_____
____ Psychiatrist	_____	_____	_____	_____
____ Psychologist	_____	_____	_____	_____
____ Marriage & Family Counselor	_____	_____	_____	_____
____ Social Worker	_____	_____	_____	_____
____ Other	_____	_____	_____	_____

For the Served Group, the determining item was number 4 on the Intake Application:

4. (a) Since the possibility of divorce was raised, have you talked with anyone concerning your problems?

____ Yes ____ No

- (b) IF "YES": Who have you talked to about these problems and have they been helpful?

Person talked to:	<u>Helpful</u>	Not <u>Helpful</u>	Not <u>Sure</u>
____ Relatives	_____	_____	_____
____ Clergyman	_____	_____	_____
____ Family Doctor	_____	_____	_____
____ Attorney	_____	_____	_____
____ Psychiatrist	_____	_____	_____
____ Psychologist	_____	_____	_____
____ Marriage & Family Counselor	_____	_____	_____
____ Social Worker	_____	_____	_____
____ Other: _____	_____	_____	_____

While we have chosen to deal with the responses to these two questions as though they were identical, we realize that they are not. The question asked of the Surveyed Group is more specific and covers a shorter time period. Also, the Surveyed Group is asked "...have they (people talked to) been helpful or not helpful?"; whereas the Served Group was asked only "...have they been helpful?". However, this secondary difference is mitigated by the range of offered responses which includes both helpful and not helpful for both groups.

Another difference between these questions is that the Surveyed Group was offered a response category entitled "Not talked to". It is the authors' opinion that this difference is not significant since the respondents checked the "Not talked to" blanks only when they did not check the "person involved".

SECTION IV: SEX

Sex was determined for the Surveyed Group by noting the case number on the file, which number included a digit indicating sex of respondent, the number one (1) indicating male and the number two (2) designating female. For the Served Group, sex was determined by observing the response to the first statement on the Intake Application:

"Application filled out by ___ Mother ___ Father."

SECTION VII: NUMBER OF CHILDREN

For both groups, information was obtained on the number of children from the present marriage only. For the Surveyed Group, number of children was obtained from the Petition for Dissolution of Marriage.

For the Served Group, if the Petition was not available, the information was obtained from the Intake Application in the following form:

Children of present marriage:

Name

SECTION VIII: EDUCATION

The questions from which we obtained the educational attainment of respondents were different on the Intake Application and the Interview Schedule forms. The Interview Schedule (for the Surveyed Group) asked:

6. (a) How many years of school have you attended?
- ☐ Less than 4 years of high school
 - ☐ Four years of high school
 - ☐ 1-3 years of college
 - ☐ 4 years of college
 - ☐ 5 or more years of college

The Intake Application asked:

6. Education.
- Years completed 1-11 12 13-15 16 17+

The authors considered these two options to be essentially the same.

SECTION IX: REFERRAL SOURCE

Since the Surveyed Group was interviewed during the pre-agency period, data on referral source was taken only from the Served Group. To determine the referral source, the authors observed responses to the

following question, available on the first page of the Intake Application:

Referred by ___ Self ___ Lawyer ___ Court ___ Prior Client
___ Clergyman ___ School ___ Physician ___ Other: _____

In summary, the methodology consisted primarily of identifying and recording significant variables and seeking to minimize any which might be confounding. Both samples were systematic samples matched for availability of data, status of divorce, and presence of a minor child or children. The two cases of overlap, discovered late in the study, do not appear to compromise the independence of the samples, given the small amount of overlap and the level of significance in differences found between the two groups.

CHAPTER III

FINDINGS

This chapter presents descriptive findings derived from the comparison of the Surveyed and Served Groups. Section I includes a summary of the overall findings. Sections II through IX present an individual analysis of each variable addressed.

SECTION I: OVERVIEW

Overall, there were small, yet statistically significant, differences between the Surveyed and the Served Groups in three areas: 1) age of respondents, 2) number of years married, and 3) people talked to about their problems. Specifically, the people who were served by the Agency tended to be somewhat older and married slightly longer, and to be less likely to have talked with their friends and more likely to have talked to an attorney about their problems than those in the Surveyed Group. In four other areas (employed income, sex, number of children, and education) there was no significant difference between these two groups. Regarding who referred the Served Group to the Agency, respondents most frequently named attorneys.

SECTION II: AGE

The ages of the Surveyed Group ranged from 16 through 48 and of the Served Group from 16 through 54. The median age of the Surveyed

Group was 29.7 and of the Served Group 32.9. At the .01 level of confidence, the difference between these two groups was significant ($df = 1$, $X^2 = 6.82$).

While the difference in age between the Surveyed and Served Groups was statistically significant, chronologically it is a very small difference--slightly more than three years (the Served Group being the older). Both groups are still in basically the same age category, late twenties/early thirties. People of these two age groups might have been in high school or college at the same time and may have had many of the same life issues to deal with especially in terms of attitudes toward divorce and counseling. So, again, while the difference in age was statistically significant, it may be effectively insignificant.

SECTION III: LENGTH OF MARRIAGE

The range of years married was divided into six subgroups: less than two years, three through five years, six through ten years, 11 through 15 years, 16 through 20 years, and more than 20 years. The median number of years married for the Surveyed Group was 8.95 and for the Served Group 10.25. At the .05 level of confidence, there was a significant difference between these two groups ($df = 5$, $X^2 = 12.90$). Table I shows the range of number of years married.

TABLE I
LENGTH OF MARRIAGE

Years Married	Surveyed Group			Served Group		
	Number	Percent	Chi Squares	Number	Percent	Chi Squares
less than 2	8	7.0	.369	14	10.0	.303
3 - 5	27	23.7	.000	33	23.7	.000
6 - 10	37*	32.4	2.709	26*	18.7	2.143
11 - 15	27	23.7	.124	29	20.9	.101
16 - 20	7	6.1	3.817	25	18.0	3.131
more than 20	8	7.0	.114	12	8.6	.093
Total	114	99.9		139	99.9	

*Intra-group

Median Category

As with the variable of age, the difference between the Surveyed and Served Groups is statistically significant, but effectively quite small; the Served Group was married just over one year longer than the Surveyed Group. Speaking only in terms of number of years married, one might again expect both groups to be dealing with similar marital life issues.

SECTION: IV: EMPLOYED INCOME

Employed income was divided into eight subgroups: less than \$400, five increments of \$200 each from \$400 through \$1399, \$1400 - \$1799, and \$1800 or more. Those who responded that they were not employed (Surveyed = 28.9 percent, Served = 26.6 percent) and those who did not respond to this question at all (Surveyed = 1.8 percent, Served = 3.6 percent) were not included in our statistics. The difference between these two unincluded groups was not significant at the .05 level of confidence ($df = 1$, $\chi^2 = .073$).

The median income of the Surveyed Group was \$866 per month and for the Served Group it was \$686. The difference between the two groups was not significant at the .05 level of confidence ($df = 7$, $\chi^2 = 13.958$). Table II below shows the distribution of employed income.

TABLE II
EMPLOYED INCOME

Employed Income	Surveyed Group			Served Group		
	Number	Percent	Chi Squares	Number	Percent	Chi Squares
less than \$400	9	11.4	.000	11	11.3	.000
\$400 - 599	15	19.0	.002	18	18.6	.002
\$600 - 799	12	15.2	.697	22*	22.7	.568
\$800 - 999	9*	11.4	.246	8	8.2	.200
\$1000 - 1199	13	16.5	2.345	6	6.2	1.909
\$1200 - 1399	12	15.2	1.018	8	8.2	1.104
\$1400 - 1799	4	5.1	2.404	15	15.4	1.958
\$1800 or more	5	6.3	.262	9	9.3	.214
Total	79	100.1		97	99.9	

*Intra-group
Median Category

There is a weakness in the findings regarding employed income in that the samples used for comparison were drawn during different time periods. Inflation during this time has been a much-talked-about factor in people's lives; however, the authors did not add an inflation factor into their calculations. Had such a factor been added in, the effect would have been to increase the difference in income between the groups. In that case the difference in incomes might have been significant.

SECTION V: PEOPLE TALKED TO

There were statistically significant differences in people respondents talked to in two different categories. Specifically, the Surveyed Group was more likely to have talked to friends ($df = 1$, $X^2 = 29.362$, level of confidence = .001) and were less likely to have talked to an attorney ($df = 1$, $X^2 = 6.184$, level of confidence = .02) than the Served Group.

Due to the small number of respondents, chi squares could not appropriately be calculated regarding the helpfulness of individual categories of people talked to. However, overall, the Surveyed Group were more likely to have found the people they talked to positively helpful ($df = 1$, $\chi^2 = 17.802$, level of confidence = .001). In calculating this statistic, responses of Not Helpful and Not Sure were aggregated into a single group of those not positively helpful and compared with the Helpful responses. A chi square was also calculated comparing only those responding Not Helpful with those responding Helpful. In this case, the Surveyed Group again were more likely to regard people talked to as being Helpful ($df = 1$, $\chi^2 = 5.868$, level of confidence = .02).

The picture that emerges from these data is that the Surveyed and Served Groups were equally as likely to have talked to most of the categories of people listed in the survey instruments (with the exception of friends and attorneys) and that the Served Group was less likely to have found talking to these people to be helpful. Further, the Served Group was also less likely to find their friends and attorneys to be helpful (based on comparisons of ratios calculated for individual categories of people talked to) and were slightly, though probably not significantly, more likely to find social workers helpful.

The authors suggest that the most probable reason for the Served Group responding that, overall, they were less likely to find the people talked to helpful is that the very fact that they found other people less than helpful was a motivating factor in their coming to the Family Court Service. That is, if the Served Group had found talking to other

people helpful, they would probably not have needed to come to the Family Court Service for assistance.

SECTION VI: SEX

There were 61 males and 53 females in the Surveyed Group, and there were 75 males and 64 females in the Served Group for a total of 253 respondents. At the .05 level of confidence, there was no significant difference between the Surveyed and the Served Group ($df = 1, \chi^2 = .003$).

One would expect no significant difference in ratios of male to female in these two groups in that in obtaining the IDCAP sample, efforts were made to involve both petitioner and respondent to the dissolution proceedings in the survey and in the Agency efforts were made (and are made) to involve both petitioner and respondent in counseling.

SECTION VII: NUMBER OF CHILDREN

The number of children in both groups ranged from one through seven with a median category in both cases of two (Surveyed = 2.36, Served = 2.40). Table V shows the distribution of each group. At the .05 level of confidence, there was no significant difference between these two group in regard to number of children ($df = 3, \chi^2 = 2.708$).

TABLE V
NUMBER OF CHILDREN

Number	Surveyed Group			Served Group		
	Number	Percent	X^2	Number	Percent	X^2
One	39	34.2	.002	47	33.8	.001
Two	50*	43.9	.152	55*	39.6	.125
Three	14	12.3	1.084	27	19.4	.889
Four - Seven	11	9.7	.250	10	7.1	.205
Total	114	100.1		139	99.9	

*Intra-group
Median

These data do not differ significantly from the Clackamas County average of 2.3 children per family (U.S. Bureau of Census, 1972). Therefore, the number of children is neither a predictor of divorce nor of Service use.

SECTION VIII: EDUCATION

The range of years of education was divided into five subgroups: 1-11 years, 12 years, 13-15 years, 16 years, and 17 or more years. The median number of years for the Surveyed Group was 13.12 years and for the Served Group it was 12.75. There was no significant difference between the groups ($df = 4$, $X^2 = 7.78$). Table VI shows the distribution of number of years of education.

TABLE VI
YEARS OF EDUCATION

Years	Surveyed Group			Served Group		
	Number	Percent	Chi Squares	Number	Percent	Chi Squares
1 - 11	18	15.8	.003	22	15.8	.002
12	37	32.5	2.108	61*	43.9	1.686
13 - 15	37*	32.5	.514	37	26.6	.411
16	10	8.8	.791	7	5.0	.633
17 or more	11	9.6	.773	8	5.8	.619
No response	1	.9		4	2.9	
Total	114	100.1		139	100.0	

*Intra-group
median category

These findings are comparable to the median education level of Clackamas County as a whole (12.4 years of education). However, the Surveyed Group indicated a median level of educational attainment of .72 years more than the County level. The Served Group was within .35 years of the County median. Therefore, education is a predictor neither of divorce nor of Service used.

SECTION IX: REFERRAL SOURCES

Fifty-nine percent of the respondents were referred to the Agency by attorneys. This is by far the most frequent source of referrals. In descending order, other referral sources were: court (13.7%), unspecified others (10.8%), self (5.7%), and prior clients (3.6%). There were no responses of referrals from clergy, physicians, or from the schools. In two cases clients received referrals from more than one source, so the total number of responses is greater than the total number of served respondents. Eight and six-tenths percent of the

respondents did not indicate any referral source. Table VII shows the response of the Served Group to the question of referral source.

TABLE VII
REFERRAL SOURCES: SERVED GROUP

Source	Number	Percent
Attorney	82	59.0
Court	19	13.7
Other (unspecified)	15	10.8
Self	8	5.7
Prior Client	5	3.6
Clergy	0	-0-
Physicians	0	-0-
Schools	0	-0-
No Response	12	8.6
Total	141	101.4

It is not surprising that a majority of referrals to the Family Court Service come from attorneys and the court. Support from the legal system is essential to the functioning of the Family Court Service in that attorneys and the court have been the traditional resource for people needing assistance with their separation and divorce. The Family Court Service has, in fact, focused most of its public relations efforts on these resources.

In summary, the findings of this study indicate that the people served by the Family Court Service were very similar to those surveyed by the IDCAP study in regard to employed income, sex, number of children, and education. They were slightly different in regard to age (being older) and number of years married (being married longer). The Served Group was also less likely to have discussed with friends the problems leading to their filing for divorce and more likely to have

discussed them with attorneys, the people most likely to have referred this group to the Family Court Service.

CHAPTER IV

DISCUSSION

In proposing this study the authors stated two purposes: 1) to determine whether the Agency was serving its target population (those people it was designed to serve), and 2) to provide a sociodemographic data base for a research project which the Agency is planning to begin July 1, 1979.

The authors have previously suggested that the target group would be comparable to the Surveyed Group, on which need for the Agency was based. Therefore, insofar as the Served Group is comparable to the Surveyed Group, it may also be comparable to the target group.

As the data have demonstrated above, the Surveyed and Served Groups are, indeed, comparable on the variables of sex, number of children, employed income, and education. There is no statistically significant difference between the two groups on these four variables. Therefore, none of these variables are to be perceived as indicators of use of the Agency's services.

The Surveyed and Served Groups did, however, differ significantly on the variables of age, length of marriage, and people talked to. As discussed above, the authors reason that while the differences in age and length of marriage were statistically significant, they are effectively quite small--the Served Group being 3.2 years older and married 1.3 years longer than the Surveyed Group. The authors further reason

that this difference, then, does not interfere with the Agency's serving its target group.

The third significant variable was people talked to. There were three significant sub-variables of people talked to: attorneys, friends, and perceived helpfulness of people talked to. The Served Group were more likely to have talked to attorneys and less likely to have talked to friends. Further, they were less likely to have found talking to people to have been helpful.

The authors reason that the Served Group may be experiencing greater conflict in divorce and therefore be more likely to talk to an attorney and to seek services of the Agency in resolving these conflicts, since one of the Agency services is divorce mediation. Persons who were experiencing little or no conflict in the divorce process might choose to file their own divorce papers and not engage the services of an attorney. Further, clients may seek Agency services for the very reason that they did not find that the people they talked to were helpful. If these people had been helpful, clients need not have sought further help elsewhere. And finally, the Served Group was more likely to have talked to attorneys who, while they were perceived as not being helpful, were in fact the most common referral source for the Agency.

The relationship between the last three factors might be, then, that people experiencing greater conflict in divorce are less likely to talk with their friends about it, are less likely to find it helpful to talk to people about their conflicts and are, therefore, more likely to seek help from an attorney who is, in turn, most likely to be the Agency's referral source.

While these last findings indicate that the Agency may not be serving a group comparable to the Surveyed Group, the authors contend that in this instance, too, the results do not indicate that it is not serving its target group. In that the Agency is serving a group which may be experiencing greater conflict in divorce and is certainly finding the people it talks to less than helpful, the Agency is serving its target group of people in need of assistance in dealing with the conflicts and issues in divorce.

Finally, while there were few and small sociodemographic differences between the Surveyed and Served Groups, provision of this information on the Served Group provides the requested data base for the Agency's proposed continuing research efforts.
